

America's energy security depends on more than good luck.

The United States imported 66 percent of its oil in 2006, and paid more for it than in any of the past 24 years, when adjusted for inflation.

We will remain the world's largest consumers of imported oil unless we transform abundant domestic coal into clean transportation fuels.

But we need more than luck to make that happen.

Congress can secure America's energy future by fostering a domestic coal-to-liquid fuels industry.

- America has a 240-year supply of coal.
- Proven technology can convert U.S. coal into clean liquid fuels for motor vehicles and aircraft.
- Clean coal-based fuels have ultra-low emissions of regulated pollutants.
- New technologies make liquid coal fuels cleaner than gasoline, and as clean as conventional diesel for carbon emissions.
